

Preferred Vendor Management System

Vendor intake, compliance and approval, native to NetSuite

Canaveral Port Authority
Prepared for

Purchasing Services
Department

Working prototype

■ What you are looking at

A working prototype of the Preferred Vendor Management System, built on your NetSuite account rather than alongside it. Three screens cover the whole vendor lifecycle: a vendor applies, the Port reviews and approves, and the vendor then manages their own compliance from a portal. Every screen is live and clickable today.

Today vendor onboarding at the Port runs on email, spreadsheets and PDF attachments. Applications arrive incomplete, certificates of insurance expire without anyone noticing until a purchase order is held, and there is no single place to see where a vendor is in the process. PVMS closes that loop inside the system you already run your purchasing in.

■ The three components

01 · INTAKE

New Vendor Application

What a prospective vendor sees.
Guided and validated so information arrives complete the first time.

- Company, contact and compliance capture
- Insurance, W-9 and certification upload
- NIGP commodity code selection
- Validation before submission, not after

02 · VENDOR

Vendor Portal

Where an approved vendor lives afterwards, so the Port stops chasing paperwork by email.

- Application status and approval history
- Document library with expiry tracking
- Purchase orders, bills and payment history
- Self service renewal before expiry

03 · PORT STAFF

PVMS inside NetSuite

The internal view. Review, score, approve and report without leaving NetSuite.

- Review queue with status and ageing
- Multi step approval workflow
- COI tracking and expiry alerts
- Compliance dashboards and audit trail

■ **How a vendor moves through it**

STEP 1 Apply Vendor completes the guided application and uploads their documents. Nothing incomplete can be submitted.	STEP 2 Review Purchasing sees it in the queue with everything attached. Risk and IT security review in sequence, each visible.	STEP 3 Approve Approval creates the vendor record in NetSuite directly. No rekeying, no second system.	STEP 4 Maintain The vendor keeps their own documents current from the portal. The Port is alerted before anything expires.
--	--	--	--

■ **What this changes**

TODAY	WITH PVMS
Applications by email and PDF	Structured, validated intake. Complete on arrival.
COI expiry found when a PO is held	Tracked with alerts before expiry, and the vendor renews it themselves.
Status lives in someone's inbox	Review queue with ageing, visible to Purchasing and to the vendor.
Vendor set up by rekeying	Approval creates the NetSuite vendor record directly.
Compliance reporting assembled by hand	Dashboards and an audit trail as a by-product of the workflow.

■ **Built on NetSuite, not beside it**

PVMS is native to your NetSuite account. That is a deliberate choice and it is what separates this from a bolt-on vendor portal. The vendor record, the purchase orders, the bills and the payment history are the same records your finance team already works in. There is no synchronisation to break, no second source of truth to reconcile, and no additional platform licence.

The prototype in front of you is the user experience, decided before any build begins. What you change now costs nothing to change.

Try it yourself

All three screens are live and clickable. The data is illustrative sample data, not live Port records, and nothing you enter is saved or submitted anywhere.

Please break it. Click everything. Where a control is not wired up yet the prototype will tell you so plainly rather than doing nothing. Note what is missing, what is named wrong, and what your team would actually do at that point in the process. That feedback is the fastest and cheapest part of the whole project.
